

The protein activation axis is real (AUROC 0.998, 130 surface proteins)

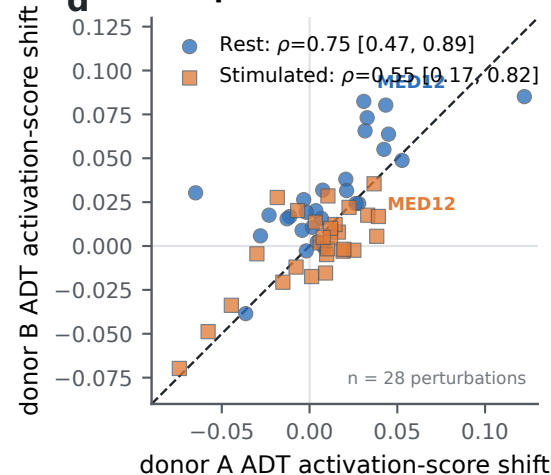

and both donors span it (A 0.997, B 0.999)

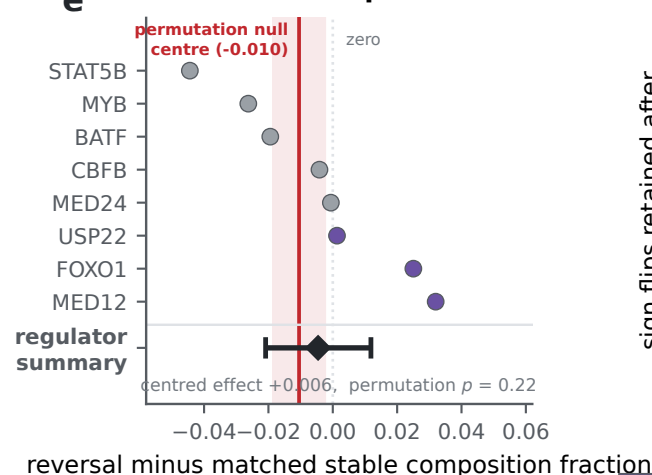

Teff and Treg separate within state (d-f use the 56,627 Teff cells)

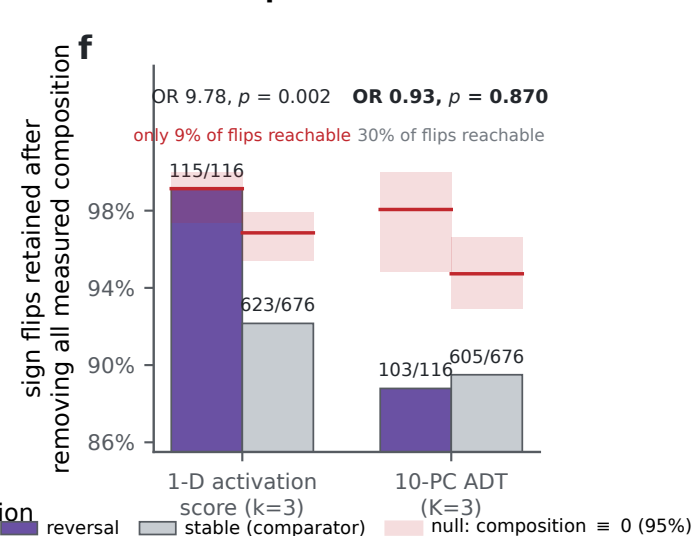

State redistribution is real and reproduces across donors

Reversal edges show no detectable excess composition

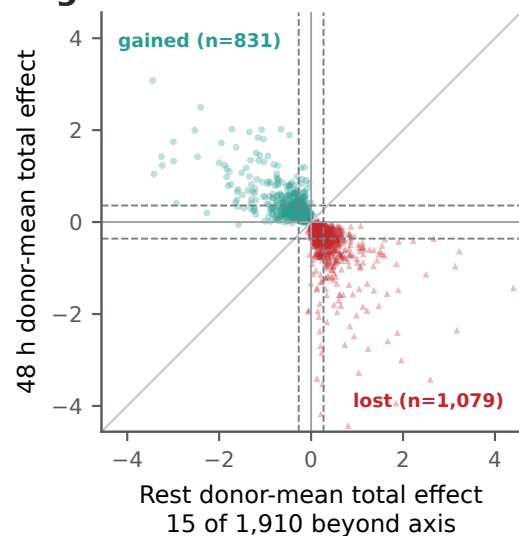

Composition erodes reversals and stable flips at the same rate

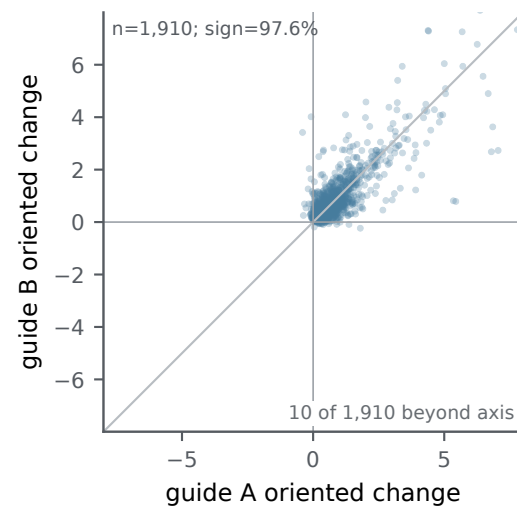

Response-shape reconstruction geometry and estimator robustness

g Rest vs 48 h total effect

h Physical-guide agreement

i Leave-one-donor agreement
